GS-2016

TATA INSTITUTE OF FUNDAMENTAL RESEARCH

Written Test in PHYSICS - December 13, 2015

Instructions for all candidates appearing for Ph.D. or Integrated Ph.D. Programme in Physics

PLEASE READ THESE INSTRUCTIONS CAREFULLY BEFORE YOU ATTEMPT THE QUESTIONS

- 1. Please fill in details about name, reference code etc. on the question paper and answer sheet. The Answer Sheet is machine-readable. Use only black/blue ball point pen to fill in the answer sheet.
- 2. This test consists of three parts, Section A, Section B and Section C. You must answer questions according to the program you are applying for:

| Candidates Applying For | Must Answer | Should Not Attempt |
|-------------------------|-------------------------|--------------------|
| Integrated Ph.D. | Section A and Section B | Section C |
| Ph.D. | Section A and Section C | Section B |

Section A contains 25 questions, Section B and Section C contain 15 questions each. Note that the test contains multiple-choice questions as well as numerical-type questions (36-40 in section B and 51-55 in section C) where you have to fill in numbers in the answer-sheet.

4. Indicate your ANSWER ON THE ANSWER SHEET by filling in the appropriate circle or circles completely for each question.

For multiple-choice questions, only ONE of the options given at the end of each question is correct. Do not mark more than one circle for any multiple choice question: this will be treated as a wrong answer.

For number-type questions, the answers should be indicated on the answer sheet by filling in circles for appropriate numbers. All three circles for each answer should be filled to get the credit. Detailed instructions are given inside the question paper.

5. The marking shall be as follows:

| | Multiple-choice | Numerical |
|---|-----------------|----------------|
| If the answer is correct: | +3 | +5 |
| If the answer is incorrect : | -1 | 0 |
| If the answer is not attempted: | 0 | 0 |
| If more than one circle is marked (only for multiple-choice): | 0 | Not applicable |

Note that there is negative marking for multiple-choice questions, but not for the numericaltype Questions

- 6. We advise you to first mark the correct answers on the QUESTION PAPER and then to TRANSFER these to the ANSWER SHEET only when you are sure of your choice.
- 7. Rough work may be done on blank pages of the question paper. If needed, you may ask for extra rough sheets from an Invigilator.
- 8. Use of calculators is permitted. Calculator which plots graphs is NOT allowed. Multiple-use devices such as cell phones, smartphones etc., CANNOT be used for this purpose.
- 9. Do NOT ask for clarifications from the invigilators regarding the questions. They have been instructed not to respond to any such inquiries from candidates. In case a correction/clarification is deemed necessary, the invigilator(s) will announce it publicly.
- 10. List of useful **physical constants** is given on the next page. Make sure to use **only** these values while answering the questions.

| USEFUL CONSTANTS | | | | |
|---------------------|---|--|--|--|
| Symbol | Name/Definition | Value | | |
| c | speed of light in vacuum | 3×10^{8} | m s-1 | |
| ħ G _N | reduced Planck constant (= $h/2\pi$) gravitational constant | 1.04×10^{-34} 6.67×10^{-11} | J s m ³ kg ⁻¹ s ⁻² | |
| M _☉ | solar mass | 1.989×10^{30} | | |
| ε_0 | permittivity of free space | 8.85×10^{-12} | F m-1 | |
| μ_0 | permeability of free space | $4\pi \times 10^{-7}$ | N A-2 | |
| e | electron charge (magnitude) | 1.6×10^{-19} | C | |
| m_e | electron mass | 9.1×10^{-31} | kg | |
| | | = 0.5 | MeV/c2 | |
| a_0 | Bohr radius | 0.51 | Å | |
| | ionisation potential of H atom | 13.6 | eV | |
| N_A | Avogadro number | 6.023×10^{23} | mol-1 | |
| k_B | Boltzmann constant | 1.38×10^{-23} | J K-1 | |
| | | $= 8.6173 \times 10^{-5}$ | eV K-1 | |
| $R = N_A k_B$ | gas constant | 8.31 | J mol-1 K-1 | |
| $\gamma = C_p/C_V$ | ratio of specific heats: monatomic gas | 1.67 | , | |
| | diatomic gas | 1.40 |) | |
| σ | Stefan-Boltzmann constant | 5.67×10^{-8} | W m-2 K-4 | |
| α | fine structure constant (= $e^2/4\pi\varepsilon_0\hbar c$) | 1/137 | , | |
| g | acceleration due to gravity | 9.8 | 3 m s-2 | |
| R_E | radius of the Earth | 6.4×10^{3} | Km | |
| R_S | radius of the Sun | 7×10^{5} | Km | |
| m_p | proton mass ($\approx 2000 m_e$) | 1.7×10^{-27} | kg | |
| m_n | neutron mass ($\approx 2000~m_e$) | 1.7×10^{-27} | | |
| | | = 939.6 | MeV/c2 | |

SECTION A

(For both Int. Ph.D. and Ph.D. candidates)

This section consists of 25 questions. All are of multiple-choice type. Mark only one option on the online interface provided to you. If more than one option is marked, it will be assumed that the question has not been attempted. A correct answer will get +3 marks, an incorrect answer will get -1 mark.

Q1. If x is a continuous variable which is uniformly distributed over the real line from x = 0 to $x \rightarrow \infty$ according to the distribution

$$f(x) = \exp(-4x)$$

then the expectation value of Cos4x is

(a) zero

(b) $\frac{1}{2}$ (c) $\frac{1}{4}$ (d) $\frac{1}{16}$

Q2. If the eigenvalues of a symmetric 3×3 matrix A are 0,1,3 and the corresponding eigenvectors can be written as

$$\begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}, \quad \begin{pmatrix} 1 \\ 0 \\ -1 \end{pmatrix}, \quad \begin{pmatrix} 1 \\ -2 \\ 1 \end{pmatrix}$$

respectively, then the matrix A^4 is

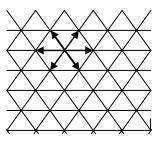

(a)
$$\begin{pmatrix} 41 & -81 & 40 \\ -81 & 0 & -81 \\ 40 & -81 & 41 \end{pmatrix}$$

(b)
$$\begin{pmatrix} -82 & -81 & 79 \\ -81 & 81 & -81 \\ 79 & -81 & 83 \end{pmatrix}$$

(c)
$$\begin{pmatrix} 14 & -27 & 13 \\ -27 & 54 & -27 \\ 13 & -27 & 14 \end{pmatrix}$$

(d)
$$\begin{pmatrix} 14 & -13 & 27 \\ -13 & 54 & -13 \\ 27 & -13 & 14 \end{pmatrix}$$

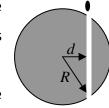

Q3. In a triangular lattice a particle moves from a lattice point to any of its 6 neighbouring points with equal probability, as shown in the figure on the right.

The probability that the particle is back at its starting point after 3 moves is

- (a) $\frac{5}{18}$
- (b) $\frac{1}{6}$
- (c) $\frac{1}{18}$

- Q4. A ball is dropped vertically from a height H on to a plane surface and permitted to bounce repeatedly along a vertical line. After every bounce, its kinetic energy becomes a quarter of its kinetic energy before the bounce. The ball will come to rest after time
 - (a) infinity
- (b) $(2H/g)^{1/2}$ (c) $2(2H/g)^{1/2}$
- Q5. In a moving car, the wheels will skid if the brakes are applied too suddenly. This is because
 - (a) the inertia of the car will carry it forward.
 - (b) the momentum of the car must be conserved.
 - (c) the impulsive retarding force exceeds the limiting force of static friction.
 - (d) the kinetic friction will suddenly get converted to static friction.
- Q6. An aircraft, which weighs $12000 \, kg$ when unloaded, is on a relief mission, carrying 4000 food packets weighing 1kg each. The plane is gliding horizontally with its engines off at a uniform speed of 540 kmph when the first food packet is dropped. Assume that the horizontal air drag can be neglected and the aircraft keeps moving horizontally. If one food packet is dropped every second, then the distance between the last two packet drops will be
 - (a) 1.5 km
- (b) 200 m
- (c) 150 m
- (d) 100 m
- Q7. Imagine that a narrow tunnel is excavated through the Earth as shown in the diagram on the left and that the mass excavated to create the tunnel is extremely small compared to Earth's mass M.

A person falls into the tunnel at one end. at time t=0. Assuming that the tunnel is frictionless, the person will

- (a) fall straight through, escaping Earth's gravity at time $2\pi\sqrt{R^3/GM}$
- (b) describe simple harmonic motion with period $2\pi (d/R)\sqrt{R^3/GM}$
- (c) describe simple harmonic motion with period $2\pi\sqrt{(R-d)^3}/GM$
- (d) describe simple harmonic motion with period $2\pi\sqrt{R^3}/GM$
- Q8. A grounded conducting sphere of radius a is placed with its centre at the origin. A point dipole of dipole moment $\vec{p} = p\hat{k}$ is placed at a distance d along the x-axis, where \hat{i},\hat{k} are the units vector along the x and z -axes respectively. This leads to the formation of an image dipole of strength \vec{p}' at a distance d' from the centre along the x-axis. If $d' = a^2/d$, then $\vec{p}' =$
 - (a) $-\frac{a^4p}{a^4}\hat{k}$
- (b) $-\frac{a^3p}{d^3}\hat{k}$ (c) $-\frac{a^2p}{d^2}\hat{k}$ (d) $-\frac{ap}{d}\hat{k}$

Q9. A long, solid dielectric cylinder of radius a is permanently polarized so that the polarization is everywhere radially outward, with a magnitude proportional to the distance from the axis of the cylinder, i.e., $\vec{P} = \frac{1}{2} P_0 r \hat{r}$. The bound charge density in the cylinder is given by

(a) $-P_0$ (b) P_0

(c) $-\frac{P_0}{2}$ (d) $\frac{P_0}{2}$

Q10. A circular loop of fine wire of radius R carrying a current I is placed in a uniform magnetic field B perpendicular to the plane of the loop. If the breaking tension of the wire is T_b , the wire will break when the magnetic field exceeds

(a) $\frac{T_b}{T_b}$

(b) $\frac{T_b}{2\pi IR}$ (c) $\frac{\mu_0 T_b}{2\pi IR}$ (d) $\frac{\mu_0 T_b}{4\pi IR}$

A gas of non-interacting particles, each of rest mass 1 MeV, is at a temperature $T = 2.0 \times 10^7 K$ Q11. and has an average particle density $n = 2.7 \times 10^{34} \ cm^{-3}$. We can obtain a reasonably correct treatment of this system

- (a) only by using special relativity as well as quantum mechanics.
- (b) by neglecting quantum mechanics but not special theory of relativity.
- (c) by neglecting special relativity but not quantum mechanics.
- (d) by neglecting both special relativity and quantum mechanics.
- A one-dimensional harmonic oscillator of mass m and natural frequency ω is in the quantum Q12. state

$$|\psi\rangle = \frac{1}{\sqrt{3}}|0\rangle + \frac{i}{\sqrt{3}}|1\rangle + \frac{i}{\sqrt{3}}|2\rangle$$

at time t=0, where $|n\rangle$ denotes the eigenstate with eigenvalue $\left(n+\frac{1}{2}\right)\hbar\omega$. It follows that the expectation value (x) of the position operator \hat{x} is

(a) $x(0) \left| \cos \omega t + \frac{1}{\sqrt{3}} \sin \omega t \right|$

(b) $x(0)[\cos \omega t - \sin \omega t]$

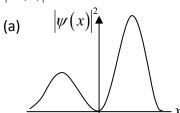

(c) $x(0) \left| \cos \omega t - \frac{1}{2} \sin \omega t \right|$

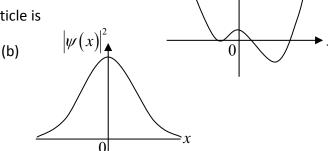

(d) $x(0) \left| \cos \omega t + \frac{1}{\sqrt{2}} \sin \omega t \right|$

Q13. A particle is confined inside a one- dimensional potential well $V\left(x\right)$,

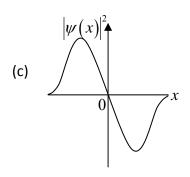

as shown on the right. One of the possible probability distributions

 $\left|\psi\left(x\right)\right|^{2}$ for an energy eigenstate for this particle is

ightharpoonup V(x)

Q14. The energy per oscillator of an isolated system of a large number of identical non-interacting fermions in a one-dimensional harmonic oscillator potential is $\frac{5\hbar\omega}{4}$, where ω is the angular frequency of the harmonic oscillator. The entropy of the system per oscillator is given by

- (a) 0.25
- (b) 0.56
- (c) 0.63
- (d) 0.75

Q15. In the temperature range 100-1000~C, the molar specific heat of a metal varies with temperature T (measured in degrees Celsius) according to the formula $C_p = \left(1 + \frac{T}{5}\right) J - \deg C^{-1}~mol^{-1}. \text{ If } 0.2~kg \text{ of the metal at } 600~C \text{ is brought in thermal contact}$

with $0.1\ kg$ of the same metal at $300\ C$, the final equilibrium temperature, in deg C, will be [Assume that no heat is lost due to radiation and/or other effects.]

- (a) 466
- (b) 567
- (c) 383
- (d) 519

Q16. In a fixed target experiment, a proton of total energy 200~GeV is bombarded on a proton at rest and produces a nucleus Z_AN and its anti-nucleus $^Z_A\bar{N}$

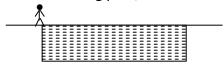

$$p + p \rightarrow^{Z}_{A} N +^{Z}_{A} \overline{N} + p + p$$

The heaviest nucleus Z_AN that can be created has atomic mass number A=

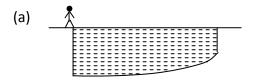

- (a) 15
- (b) 9
- (c) 5
- (d) 4

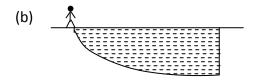

- Q17. In a simple cubic lattice of lattice constant $0.287 \ nm$, the number of atoms per mm^2 along the $111 \ \text{plane}$ is
 - (a) 2.11×10^{13}
- (b) 1.73×10^{13}
- (c) 1.29×10^{13}
- (d) 1.21×10^{13}
- Q18. In a glass fibre, light propagates by total internal reflection from the inner surface. A very short pulse of light enters a perfectly uniform glass fibre at t=0 and emerges from the other end of the fibre with negligible losses. If the refractive index of the glass used in the fibre is 1.5 and its length is exactly $1.0\ km$, the time t at which the output pulse will have completely exited the fibre will be
 - (a) $5.0 \ \mu s$
- (b) $7.5 \mu s$
- (c) 25 ns
- (d) 750 ns
- Q19. In an ionization experiment conducted in the laboratory, different singly- charged positive ions are produced and accelerated simultaneously using a uniform electric field along the x-axis. If we need to determine the masses of various ions produced, which of the following methods will NOT work
 - (a) Detect them at a fixed distance from the interaction point along x-axis and measure their time of arrival.
 - (b) Apply a uniform magnetic field along $\,y$ -axis and measure the deviation.
 - (c) Apply a uniform electric field along y -axis and measure the deviation.
 - (d) Apply a uniform electric field along y -axis and a (variable) uniform magnetic field along z -axis simultaneously and note the zero deviation.
- Q20. An observer stands at the edge of a swimming pool, as sketched in the figure below.

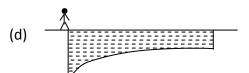

This observer will perceive the pool as

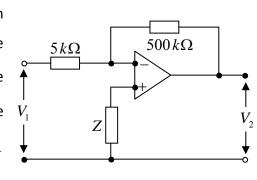

- Q21. Consider a process in which atoms of Actinium- $226\binom{226}{89}Ac$ get converted to atoms of Radium- $226\binom{226}{88}Ra$ and the yield of energy is 0.64~MeV per atom. This occurs through
 - (a) Both $p \rightarrow n + e^+ + v_e$ and $p + e^- \rightarrow n + v_e$
 - (b) Both $p \rightarrow n + e^+ + v_e$ and $n \rightarrow p + e^- + \overline{v}_e$
 - (c) only $p \rightarrow n + e^+ + v_e$
 - (d) only $p + e^- \rightarrow n + v_e$
- Q22. Two homonuclear diatomic molecules produce different rotational spectra, even though the atoms are known to have identical chemical properties. This leads to the conclusion that the atoms must be
 - (a) isotopes, i.e. with the same atomic number.
 - (b) isobars, i.e. with the same atomic weight.
 - (c) isotones, i.e. with the same neutron number.
 - (d) isomers, i.e. with the same atomic number and weight.
- Q23. In the generalized operational amplifier circuit shown on the right, the op amp. has a very high input impedance $\left(Z > 50~M\Omega\right)$ and an open gain of 1000 for the frequency range under consideration. Assuming that the op . amp. draws negligible current, the voltage ratio $\frac{V_2}{V_c}$

is approximately

(a)
$$-190$$

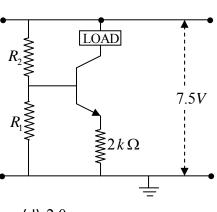

(b)
$$-190$$

$$(c) -90$$

(d) 80

Q24. In the transistor circuit shown on the right, assume that the voltage drop between the base and the emitter is $0.5\,V$.

What will be the ratio of the resistances $\frac{R_2}{R_1}$ in order to make this circuit function as a source of constant current, I=1mA?

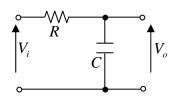

(a) 4.5

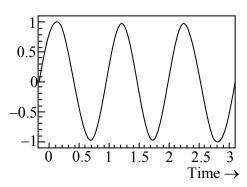

(b) 3.0

(c) 2.5

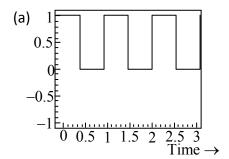

(d) 2.0

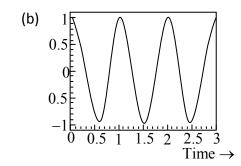

Q25. For the circuit depicted on the right, the input voltage V_i is a simple sinusoid as shown below, where the time period is much smaller compared to the time constant of this circuit.

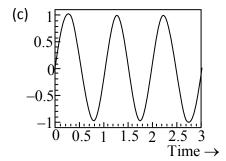

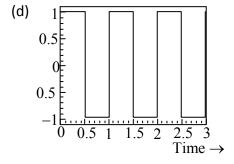

The voltage V across C is best represented by

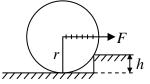

Section B

To be attempted only by candidates for Integrated Ph.D. programmer.

(Candidates for Ph.D. programmer will get NO credit for attempting this section.)

Q26. The integral
$$\int_0^\infty \frac{dx}{x} \left[\exp\left(-\frac{x}{\sqrt{3}}\right) - \exp\left(-\frac{x}{\sqrt{2}}\right) \right]$$
 evaluates to

- (a) zero
- (b) 2.03×10^{-2} (c) 2.03×10^{-1}
- (d) 2.03
- Q27. A uniform solid wheel of mass M and radius r is halted at a step of height h as shown in the figure. The minimum force F , applied horizontally at the centre of the wheel, necessary to raise the wheel over this step is

(a)
$$Mg \frac{\sqrt{h(2r-h)}}{r+h}$$

(b)
$$Mg \frac{\sqrt{h(2r+h)}}{r-h}$$

(c)
$$Mg \frac{\sqrt{h(r+h)}}{r-h}$$

(d)
$$Mg \frac{\sqrt{h(2r-h)}}{r-h}$$

Q28. In a futuristic scenario, two spaceships, A and B, are running a race, where they start from the same point (marked START) but fly in opposite directions at constant speeds close to the speed of light. An observer fixed at the starting point observes that they both cross the points marked END, which are equidistant from the starting point, at the same time. Afterwards this observer receives messages from both spaceships.

Which of the following could be true?

- (a) Both A and B agree that A won the race.
- (b) A and B both claim to have won the race.
- (c) Both A and B agree that they crossed the end point simultaneously. A thinks B won the race while B thinks A won the race.

Q29. The equation of state for a gas is given by

$$\left[p + \left(\frac{\alpha N}{V} \right)^2 \right] (V - \beta N) = Nk_B T$$

where P,V,T,N and $k_{\scriptscriptstyle B}$ represent pressure, volume, temperature, number of atoms and the Boltzmann constant, respectively, while α and β are constants specific to the gas.

If the critical point C corresponds to a point of inflexion of the p-V curve, then the critical volume V_C and critical pressure p_C for this gas are given by

(a)
$$V_C = 3\beta N, p_C = \alpha^2/3\beta^2$$

(b)
$$V_C = 3\beta N, p_C = \alpha / 27\beta^2$$

(c)
$$V_C = 3\beta N, p_C = 8\alpha^2 / 27\beta$$

(d)
$$V_C = 3\beta N, p_C = \alpha^2 / 27\beta^2$$

Q30. The lattice constant of a material is of the order of a μm , and its bond energies are of the order of an eV. The bulk modulus of such a material, in Pascals, is of the order of

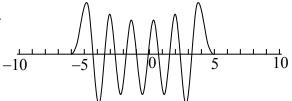

(a)
$$10^{-1}$$

(b)
$$10^{-3}$$

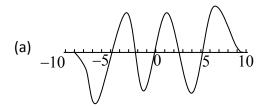

(c)
$$10^{-6}$$

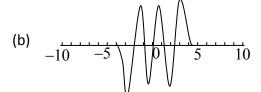

(d)
$$10^9$$

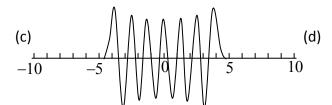

Q31. Two harmonic oscillators A and B are in excited eigenstates with the same excitation energy E, as measured from their respective ground state energies. The natural frequency of A is twice that of B.

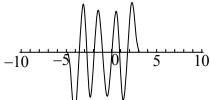

If the wavefunction of B is as sketched in the above picture, which of the following would best represent the wavefunction of A?

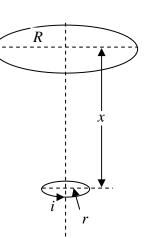

Three positively charged particles lie on a straight line at positions 0, x and 10 as indicated in Q32. the figure below. Their charges are Q, 2Q, and 4Q cm respectively.

If the charges at x = 10 are fixed and the charge at x is movable, the system will be in equilibrium when x =

- (a) 8
- (b) 2
- (c) $\frac{20}{3}$
- (d) $\frac{10}{2}$
- Consider the following system. Two circular loops of wire are placed Q33. horizontally, having a common axis passing vertically through the centre of each coil (see figure). The lower loop has radius r and carries a current i as shown in the figure. The upper loop has a radius R(R >> r) and is at a distance x(x >> r) above it.

If the lower loop is held fixed and the upper loop moves upwards with a uniform velocity $v = \frac{dx}{dx}$, then the induced e.m.f. and the direction of the induced current in this loop will be

- (a) $3i\mu_0\pi^2r^2\frac{R^2v}{2x^4}$; anti-clockwise
- (b) $2i\mu_0\pi^2r^2\frac{R^2v}{2r^4}$; clockwise
- (c) $3i\mu_0\pi^2r^2\frac{R^2v}{2r^3}$; anti-clockwise (d) $2i\mu_0\pi^2r^2\frac{R^2v}{2r^3}$; clockwise
- A student in the laboratory is provided with a bunch of standard resistors as well as the Q34. following instruments
 - Thermometer accurate to 0.1 C Voltmeter accurate to 0.1 V
 - Ammeter accurate to 0.01 A — Stop watch accurate to $0.05 \ s$
 - Constant current source (ideal)
 Constant voltage source (ideal)

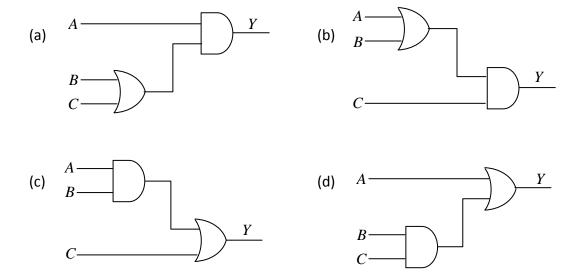

Using this equipment (and nothing else), the student is expected to measure the resistance R of one of the given resistors. The least accurate result would be obtained by

- (a) measuring the Joule heating.
- (b) passing a constant current and measuring the voltage across it.
- (c) measuring the current on application of a constant voltage across it.
- (d) the Wheatstone bridge method.

Q35. In a digital circuit for three input signals (A, B and C) the final output (Y) should be such that for inputs

the output (Y) should be low and for all other cases it should be high. Which of the following digital circuits will give such output?

PLEASE READ CAREFULLY BEFORE PROCEEDING FURTHER

The following questions (36 -40) must be answered by integers of 3 digits each. You may round off, e.g. $123.0 \le x < 123.5$ as x = 123 and e.g. $123.5 \le x \le 124.0$ as x = 124 and so on. Answer these questions on the OMR by filling in bubbles as you did for your reference code. Use only values of constants given in the table 'USEFUL CONSTANTS'.

Note that if the answer is, e.g. 25, you must fill in 025 and if it is, e.g. 5, you must fill in 005. If it is 0, you must fill in 000. If the zeros are not filled in (where required), the answer will be not be credited.

There are NO NEGATIVE MARKS for these questions.

Q36. On a planet having the same mass and diameter as the Earth, it is observed that objects become weightless at the equator. Find the time period of rotation of this planet in minutes (as defined on the Earth).

Website: www.pravegaa.com | Email: pravegaaeducation@gmail.com

14

Q37. The function y(x) satisfies the differential equation

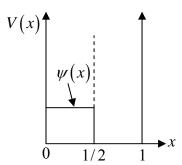

$$x\frac{dy}{dx} = y(\ln y - \ln x + 1)$$

with the initial condition y(1) = 3. What will be the value of y(3)?

- Q38. Two containers are maintained at the same temperature and are filled with ideal gases whose molecules have mass m_1 and m_2 respectively. The mean speed of molecules of the second gas is 10 times the r.m.s. speed of the molecules of the first gas. Find the ratio of $\frac{m_1}{m_2}$ the nearest integer.
- Q39. A particle is confined in a one-dimensional box of unit length, i.e. L=1, i.e. in a potential

$$V(x) = \begin{cases} 0 & if \ 0 < x < 1 \\ \infty & \text{otherwise} \end{cases}$$

The energy eigenvalues of this particle are denoted E_1,E_2,E_3,\dots In a particular experiment, the wavefunction of this particle, at t=0 , is given by

15

$$\psi(x) = \begin{cases} \sqrt{2} & if \ 0 < x < \frac{1}{2} \\ 0 & \text{otherwise} \end{cases}$$

If, simultaneously, i.e. at t=0, a measurement of the energy of the particle is made, find $100\,p_3$, where p_3 is the probability that the measurement will yield the energy E_3

Q40. Consider a sawtooth waveform which rises linearly from 0 Volt to 1 Volt in $10 \, ns$ and then decays linearly to 0V over a period of $100 \, ns$. Find the r.m.s. voltage in units of milliVolt?

Section C

To be attempted only by candidates for Ph.D. programme.

(Candidates for Integrated Ph.D. programme will get NO credit for attempting this section.)

The value of the integral Q41.

$$\oint_C \frac{\sin z}{z^6} dz$$

where C is the circle of centre z = 0 and radius = 1

(a) $i\pi$

(b) $\frac{i\pi}{120}$

(c) $\frac{i\pi}{\epsilon 0}$

(d) $\frac{-i\pi}{6}$

In a Rutherford scattering experiment, the number N of particles scattered in a direction θ , i.e.

 $\frac{dN}{d\theta}$, as a function of the scattering angle θ (in the laboratory frame) varies as

(a) $\csc^4 \frac{\theta}{2}$

(b) $\csc^2 \frac{\theta}{2} \cot \frac{\theta}{2}$ (c) $\csc^2 \frac{\theta}{2} \tan^2 \frac{\theta}{2}$ (d) $\sec^4 \frac{\theta}{2}$

In a simple stellar model, the density ρ of a spherical star of mass M varies according to the Q43. distance r from the centre according to

$$\rho(r) = \rho_0 \left(1 - \frac{r^2}{R^2} \right)$$

where R is the radius of the star. The gravitational potential energy of this star

(in terms of Newton's constant G_N) will be

(a) $\frac{-G_N M^2}{4\pi R}$ (b) $\frac{-3G_N M^2}{5R}$ (c) $\frac{-5G_N M^2}{7R}$

A particle moving in one dimension is confined inside a rigid box located between $x = \frac{-a}{2}$ and Q44.

 $x = \frac{a}{2}$. If the particle is in its ground state

$$\psi_0(x) = \sqrt{\frac{2}{a}} \cos \frac{\pi x}{a}$$

the quantum mechanical probability of its having a momentum p is given by

(a) $\frac{8h^4}{(\pi^2h^2 - p^2a^2)^2}\cos^2\frac{pa}{2h}$

(b) $\frac{\pi^2 h^4}{\left(\pi^2 h^2 - p^2 a^2\right)^2} \sin^2 \frac{pa}{2h}$

(c) $\frac{2h^4}{(\pi^2h^2 + p^2a^2)}\cos^2\frac{pa}{2h}$

(d) $\frac{16h^4}{(\pi^2h^2-p^2a^2)^2}$

Consider two spin- $\frac{1}{2}$ identical particles A and B , separated by a distance r , interacting Q45. through a potential

$$V(r) = \frac{V_0}{r} \vec{S}_A \cdot \vec{S}_B$$

where V_0 is a positive constant and the spins are $\vec{S}_{A.B} = \vec{\sigma} = (\sigma_x, \sigma_y, \sigma_z)$ in terms of the Pauli spin matrices. The expectation values of this potential in the spin- singlet and triplet states are

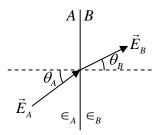

(a) Singlet:
$$-\frac{V_0}{3r}$$
, Triplet: $\frac{V_0}{r}$

(b) Singlet:
$$-\frac{3V_0}{r}$$
, Triplet: $\frac{V_0}{r}$

(c) Singlet:
$$\frac{3V_0}{r}$$
, Triplet: $-\frac{V_0}{r}$ (d) Singlet: $-\frac{V_0}{r}$, Triplet: $\frac{3V_0}{r}$

(d) Singlet:
$$-\frac{V_0}{r}$$
, Triplet: $\frac{3V_0}{r}$

Two semi-infinite slabs A and B of dielectric constant \in_{A} and \in_{B} meet in a plane interface, as Q46. shown in the figure below.

If the electric field in slab A makes an angle $heta_{\!\scriptscriptstyle A}$ with the normal to the boundary and the electric field in slab B makes an angle θ_B with the same normal (see figure), then

(a)
$$\cos \theta_A = \frac{\epsilon_A}{\epsilon_B} \cos \theta_B$$

(b)
$$\sin \theta_A = \frac{\epsilon_A}{\epsilon_B} \sin \theta_B$$

(c)
$$\tan \theta_A = \frac{\epsilon_A}{\epsilon_B} \tan \theta_B$$

(d)
$$\sin \theta_A = \frac{\epsilon_B}{\epsilon_A} \sin \theta_B$$

The Weizsacker semi-empirical mass formula for an odd nucleus with Z protons and AQ47. nucleons may be written as

$$M(Z,A) = \alpha_1 A + \alpha_2 A^{\frac{2}{3}} + \alpha_3 Z + \alpha_4 Z^2$$

where the $\,a_{i}\,$ are constants independent of $\,Z,A\,$. For a given $\,A$, if $\,Z_{A}\,$ is the number of protons of the most stable isobar, the total energy released when an unstable nuclide undergoes a single eta^- decay to $(Z_{\scriptscriptstyle A},A)$ is

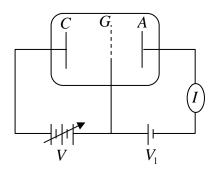

(a)
$$\alpha_3$$

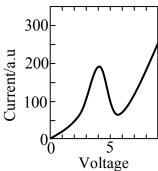

(b)
$$\alpha_{4}$$

(c)
$$\alpha_4 - \alpha_3$$

(d)
$$\alpha_1 + \alpha_2$$

Q48. In the experiment shown in figure (i) below, the emitted electrons from the cathode (C) are made to pass through the mercury vapor filled in the tube by accelerating them using a grid (G) at potential V positive w.r.t. the cathode. The electrons are collected by the anode (A).

The variation of electron current (I) as a function of V is given in (i) and (i) and (i) are a function of V is given in (i) and (i) are a function of V is given in (i) and (i) and (i) are a function of V is given in (i) and (i) are a function of V is given in (i) and (i) are a function of V is given in (i) and (i) are a function of V is given in (i) and (i) are a function of V is given in (i) and (i) are a function of V is given in (i) and (i) are a function of (i

- (a) ionization of mercury atoms.
- (b) an emission line from mercury atoms.
- (c) attachment of electrons to mercury atoms.
- (d) resonant backscattering of electrons to cathode from grid.
- Q49. The dispersion relation for electrons in the conduction band of a n-type semiconductor has the form $E(k) = ak^2 + b$ where a and b are constants. It was observed that the cyclotron resonance frequency of such electrons is $\omega_0 = 1.8 \times 10^{11} \ rad \ S^{-1}$, when placed in a magnetic field $B = 0.1 \ Wm^{-2}$. It follows that the constant a must be about
 - (a) 10^{-36}
- (b) 10^{-28}
- (c) 10^{-32}
- (d) 10^{-38}
- Q50. Consider the hyperon decay $(1)A \rightarrow n + \pi^0$ it followed by $(2)\pi^0 \rightarrow \gamma\gamma$. If the isospin component, baryon number and strangeness quantum numbers are denoted by I_z, B and S respectively, then which of the following statements is completely correct?
 - (a) In (1) $I_{\scriptscriptstyle Z}$ is not conserved, $\it B$ is conserved, $\it S$ is not conserved;
 - In (2) I_Z is conserved, B is conserved, S is conserved.
 - (b) In (1) I_Z is conserved, B is not conserved, S is not conserved;
 - In (2) I_Z is conserved, B is conserved, S is conserved.
 - (c) In (1) I_Z is not conserved, B is conserved, S is not conserved;
 - In (2) I_Z is not conserved, B is conserved, S is conserved.
 - (d) In (1) I_Z is not conserved, B is conserved, S is conserved;
 - In (2) I_Z is conserved, B is conserved, S is conserved.

PLEASE READ CAREFULLY BEFORE PROCEEDING FURTHER

The following questions (51 -55) must be answered by integers of 3 digits each. You may round off, e.g. $123.0 \le x < 123.5$ as x = 123 and e.g. $123.5 \le x \le 124.0$ as x = 124 and so on. Answer these questions on the OMR by filling in bubbles as you did for your reference code. Use only values of constants given in the table 'USEFUL CONSTANTS'.

Note that if the answer is, e.g. 25, you must fill in 025 and if it is, e.g. 5, you must fill in 005. If it is 0, you must fill in 000. If the zeros are not filled in (where required), the answer will be not be credited.

There are NO NEGATIVE MARKS for these questions.

Q51. Given the infinite series

$$y(x) = 1 + 3x + 6x^{2} + 10x^{3} + ... + \frac{(n+1)(n+2)}{2}x^{n} + ...$$

find the value of y(x) for $x = \frac{6}{7}$

Q52. A quantum mechanical plane rotator consists of two rigidly connected particles of mass m and connected by a massless rod of length d is rotating in the xy plane about their centre of mass. Suppose that the initial state of the rotor is given by

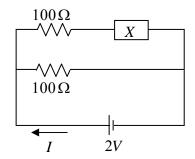

$$\psi(\phi, t=0) = A\cos^2\phi$$

where φ is the angle between one mass and the x axis, while A is a normalization constant. Find the expectation value of $3\hat{L}_z^2$ in this state, in units of \hbar^2

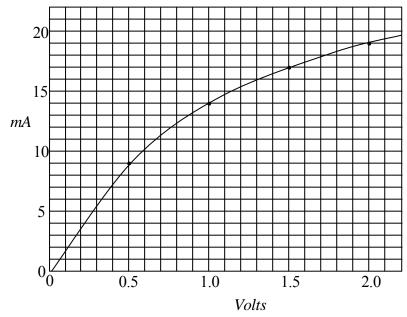

- Q53. A continuous monochromatic ($\lambda=600~nm$) laser beam is chopped into 0.1~ns pulses using some sort of shutter. Find the resultant line-width $\Delta\lambda$ of the beam in units of $10^{-3}~nm$.
- Q54. N distinguishable particles are distributed among three states having energies $E=0,k_BT$ and $2k_BT$ respectively. If the total equilibrium energy of the system is $138.06\ k_BT$, find the number N of particles.

Q55. The circuit shown below contains an unknown device X

The current-voltage characteristics of the device X were determined and shown in the plot given below.

Determine the current I (in mA) flowing through the device X.
